Symbols

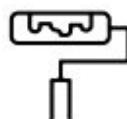

suitable for wood

suitable for high temperatures

suitable for machine processing

suitable for manual processing

suitable for packaging / cardboard

waterproof

WATER RESISTANT

Standard container sizes

IBC

*bucket
5 kg
30 kg*

Tanker truck

Other container sizes are available after prior consultation!

General information

► adhesion und cohesion

adhesion: bonding between two interfaces

cohesion: bonding within a material = interior stability

► structural robustness dry/wet

Maximal capacity to withstand stresses

► solid matter

rest of mass after drying = water- und solventfree content of adhesive

► storage stability

durability of adhesive

► mechanical flow behaviour

change of viscosity with mechanical stress

► open time

interval between application and adding together the adherends

► pH-value

acid ($pH < 7$), neutral ($pH = 7$) and alkaline ($pH > 7$) character of adhesives, influences characteristics like storage stability, stability of pipes etc.

► brushability

characteristic of processability

► pot life

interval between blending of a polyblend adhesive and the end of its plasticity

► behave of drying

qualities until drying of the mobile phase (solvents like water and additives)

► discoloration

unwanted discoloration through interaction between adhesive and wood ingredients

► viscosity

flow behaviour; basic characteristic for processing, flowing, film boiling and storage stability

► heat resistance

mechanical stability of adhesive at 80 °C

► white point

= minimum film forming temperature; lowest temp. when dispersions forming a coherent film; at this point the dispersion has a white colour

Classification by DIN EN 204 (for wood)

D1	for indoor use	low air humidity, temperature more than 50 °C for a short time, Humidity of wood max. 15 %	Furniture, interior fixtures, room doors, dry rooms „dry strength“
D2	for indoor use	sporadic high air humidity, Humidity of wood max. 18 %	Furniture, interior fixtures, room doors in kitchen and bathrooms, humid rooms without wet areas „humid strength“
D3	for indoor and outdoor use	high air humidity, contact with water for a short time	Fixtures in wet rooms, doors and windows protected from weather, „cold water strength“
D4	for indoor and outdoor use	frequent contact with water for a long time	Outdoor areas, doors (not protected from weather), windows with surface protection „cooking water strength“

Product overview

Crosslinking agents & adhesives for special materials

Miracol release agent UF/MF

Release agent for pressing veneered surfaces by using adhesives based on
Urea- and melamine resins.

Miracol Release agent protects surfaces of pressing plates / sheet metals; the veneered areas don't adhere on the pressing plates and residues of adhesive can be removed very simply. For all pressing temperatures.

Cleaner Miracol 9702

Cleaning agent for every equipment used with adhesives
Urea- and melamine resins.

Works best when mixed into rest of adhesive. Reduces adhesive power after 5 minutes so the rest of adhesive can be washed away with water.

Cleaner Bilstar Kamina

Interacts with dried adhesives on large surfaces without smearing. Can be used for
dispersions or PVA adhesive.

Bilstar Kamina should be sprayed on dry glue. After an exposure time of approx. 15 min the adhesive can be wiped away. At least rinse with clear water; if necessary repeat the process.

Hardener Miracol 9518 (with solvents)

Increases water resistance and heat resistance for dispersion glues.

Polyvinylacetatdispersions (crosslinker)

Add 5 % Miracol 9518 / dispersion ⇒ homogenous stirring

Pot life at 20 °C for at least **8 hours**.

Hardener Miracol 1507 (green, without solvents)

Increases water resistance and heat resistance for special dispersion glues.

Polyvinylacetatdispersions (crosslinker)

Add 5 % Miracol 1507 / dispersion ⇒ homogenous stirring

Pot life at 20 °C for at least **8 hours**.

Hardener Miracol 9524 (blue, without solvents)

Increases water resistance and heat resistance for special dispersion glues.

Polyvinylacetatdispersions (crosslinker)

Add 5 % Miracol 9524 / dispersion ⇒ homogenous stirring

Pot life at 20 °C for at least **10 days**.

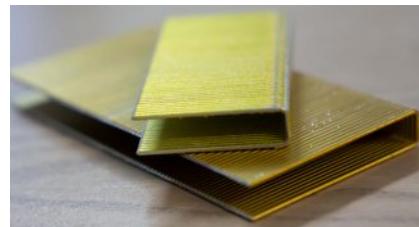

How to apply hardener

<p>correct</p> <p>Stirr in the hardener slowly to the dispersion.</p> <p>The density of the hardener is higher than the dispersion. ($\rho = 1,3 \text{ g/cm}^3$)</p> <p>Without stirring the hardener is going to set down.</p>	<p>incorrect</p> <p>Hardener sets down.</p> <ul style="list-style-type: none">- pH-differences are possible- Inhomogenous dispersion- Coagulation is possible
--	--

Research & Development

Adhesive for metal fibre bundles

Skin adhesive

e. g. for support stockings

adhesive for tattoos

Adhesive for table tennis rackets

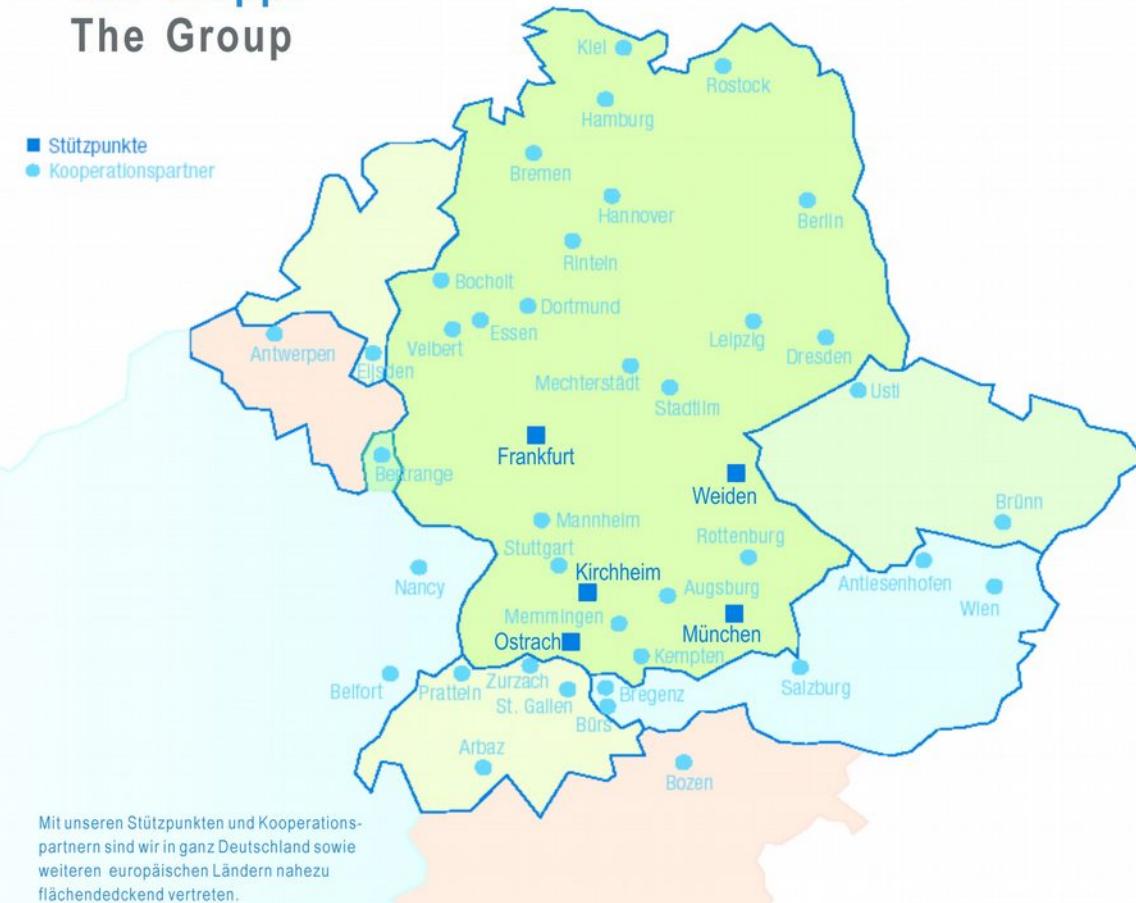

Adhesive for puzzles

All products are available in different **colours**.

Die Gruppe The Group

We are represented through our bases and cooperation partners nationwide in Germany and also in other countries.
